

# Cycle times of vanadium flow battery

## Overview

---

The electrodes in a VRB cell are carbon based. Several types of carbon electrodes used in VRB cell have been reported such as carbon felt, carbon paper, carbon cloth, and graphite felt. Carbon-based materials have the advantages of low cost, low resistivity and good stability. Among them, carbon felt and graphite felt are preferred because of their enhanced three-dimension.

Other useful properties of vanadium flow batteries are their fast response to changing loads and their overload capacities. They can achieve a response time of under half a millisecond for a 100% load change, and allow overloads of as much as 400% for 10 seconds.

In this work, a life cycle assessment of a 5 kW vanadium redox flow battery is performed on a cradle-to-gate approach with focus on the vanadium electrolytes, since they determine the battery's storage capacity and can be readjusted and reused indefinitely. The functional unit is 1 kWh stored by.

The vanadium redox battery (VRB), also known as the vanadium flow battery (VFB) or vanadium redox flow battery (VRFB), is a type of rechargeable flow battery which employs vanadium ions as charge carriers. [5] The battery uses vanadium's ability to exist in a solution in four different oxidation.

A vanadium flow battery works by circulating two liquid electrolytes, the anolyte and catholyte, containing vanadium ions. During the charging process, an ion exchange happens across a membrane. This process changes the oxidation states of the vanadium ions, leading to efficient electricity.
