

New Energy Vehicle Flow Battery

Overview

Illinois Institute of Technology (IIT) is collaborating with Argonne National Laboratory to develop a rechargeable flow battery for EVs that uses a nanotechnology-based electrochemical liquid fuel that offers over 30 times the energy density of traditional electrolytes.

Bromine-based flow batteries store energy using a chemical reaction between bromide ions and elemental bromine. This chemistry is attractive because bromine is widely available, has a high electrochemical potential, and dissolves well in liquid electrolytes. The downside appears during charging.

Advances in solid-state, sodium-ion, and flow batteries promise higher energy densities, faster charging, and longer lifespans, enabling electric vehicles to travel farther, microgrids to operate efficiently, and renewable energy to integrate seamlessly into the grid. Next-gen batteries are no.

Flow batteries, which store.

The battery in her EV is a variation on the flow battery, a design in which spent electrolyte can be replaced, the fastest option, or the battery could be directly recharged, though that takes longer. Flow batteries are safe, stable, long-lasting, and easily refilled, qualities that suit them well.
