Method: Repair involves identifying and replacing weak or defective cells or modules within the battery. This approach can extend the lifespan of the battery without requiring a full replacement. Benefits: Sustainability: Repairing batteries reduces the demand for new battery materials like lithium.

In contrast, repairing a battery with a single remanufactured module emits only 951kg of CO<sub>2</sub>, reducing emissions by 93% per restored pack, equivalent to offsetting over 12,000kg of carbon\* (learn more in our recently published report). It is essential to maximise the service life of cells, modules.
