This guide describes a variety of approaches that local governments can use to advance climate and energy goals by meeting some or all of their electricity needs through on-site renewable energy generation. The sections in this guide discuss how local governments can work with utilities, local.

On-site renewable generation refers to the production of clean and sustainable energy from renewable sources at or near the location where it is consumed. It involves setting up renewable energy systems like solar panels, wind turbines, or small-scale hydroelectric generators to generate.

Reduce utility costs, achieve energy independence and meet your sustainability goals by generating your own on-site power—and even selling surplus energy back to the grid. Controlling your own energy supply means more predictable and reliable energy generation that lowers costs and environmental.
